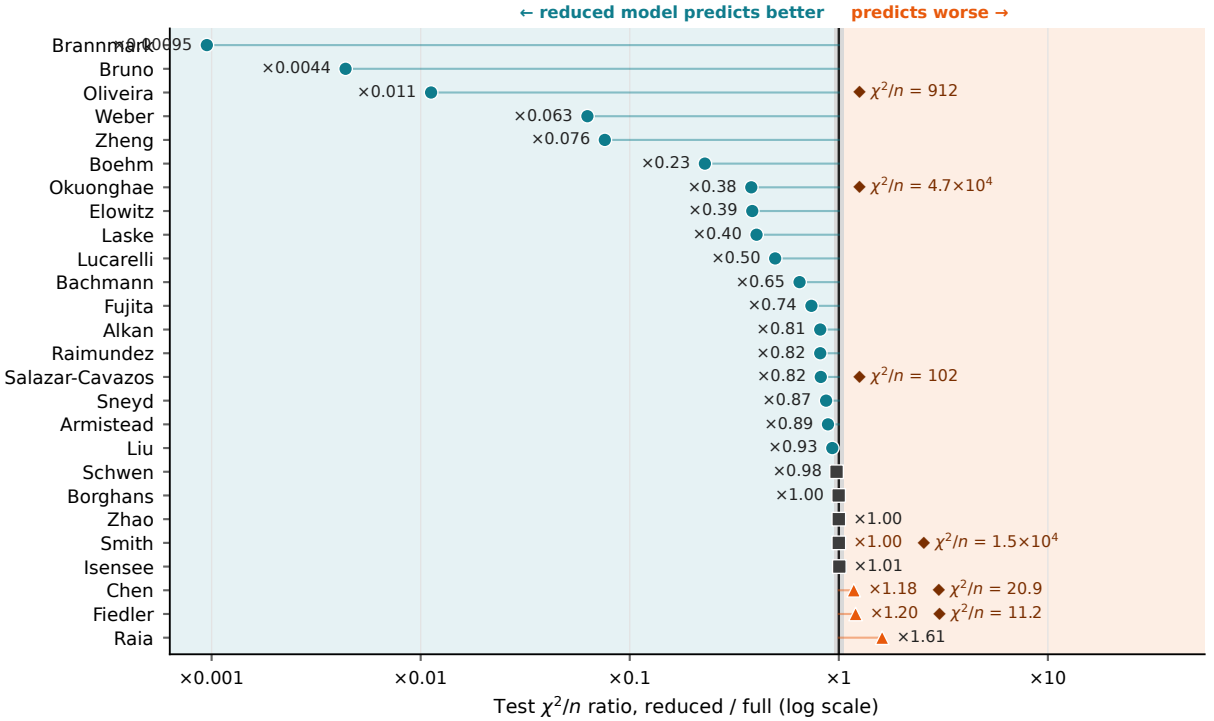
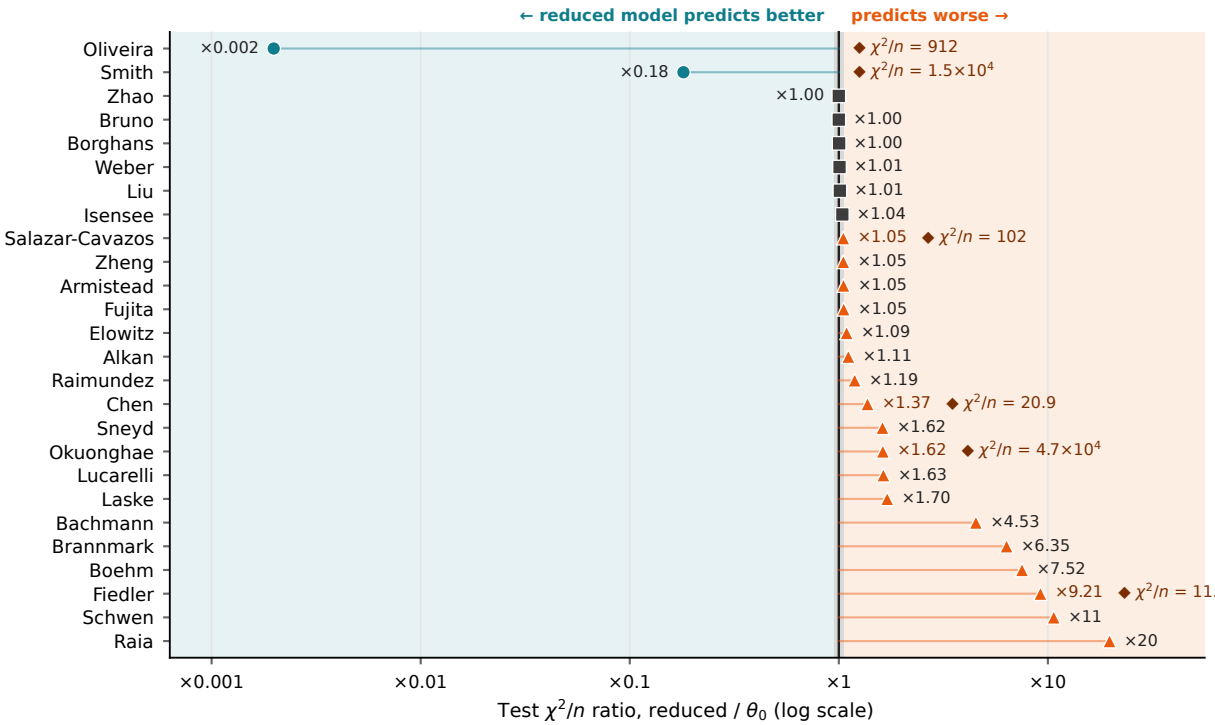
a **Reduced model vs full model re-estimated on training data**



Not shown: Beer, Crauste, Lang (no admissible subset); Bertozzi (selected parameters act only in test conditions); Blasi (no training/test split possible); Giordano, Perelson, Rahman (noise-free data (θ_0 test $\chi^2/n < 0.01$)).

b **Reduced model vs published estimate θ_0**



Not shown: Beer, Crauste, Lang (no admissible subset); Bertozzi (selected parameters act only in test conditions); Blasi (no training/test split possible); Giordano, Perelson, Rahman (noise-free data (θ_0 test $\chi^2/n < 0.01$)).

$\chi^2/n \approx 1$ indicates residuals comparable to the reported measurement noise.

better (ratio < 0.95) · worse (ratio > 1.05) · reduced $\chi^2/n > 10$: poor absolute fit
